## Acknowledgement

I extend my heartfelt gratitude to all AFSIS Focal Points and their dedicated staff for their unwavering support and invaluable contributions in providing the essential data analysed in this ACO report No. 31. My sincere thanks to Mr. Charapon Chantorn and Mr. Thanapat Chukaew for their meticulous preparation of ACO forms, data collection from member countries, rigorous analysis, and the creation of this comprehensive report. The timely release of ACO report No. 31 is a testament to the significant contributions, admirable efforts, and hard work of all member countries involved.

This collaborative effort truly exemplifies the spirit of cooperation among the ASEAN member countries. The ACO report No. 31, along with its predecessors, stands as a valuable resource benefiting all ASEAN members, policy makers, and relevant agencies. These reports serve as essential tools for planning and policymaking, crucial in ensuring food security within individual nations and the ASEAN regions.

I am deeply thankful to the Office of Agricultural Economics, Ministry of Agriculture and Cooperatives, Thailand, for their continuous support. Their provision of office space, dedicated staff, and financial assistance has played a vital role in the seamless execution of all AFSIS activities.

I express my profound appreciation to the Plus Three Countries and various organizations for their steadfast support of AFSIS activities, particularly in the human resource development. A special note of gratitude is reserved for the Ministry of Agriculture, Forestry, and Fisheries, Government of Japan, for their consistent financial backing, enabling the realization of AFSIS's initiatives.

I extend my sincere thanks to all previous AFSIS Managers for their invaluable guidance, unwavering support, and kindness towards the AFSIS Secretariat.

Lastly, I am deeply grateful to all other AFSIS staff members for their dedication and hard work in the execution of all AFSIS activities. Your collective efforts have significantly contributed to the achievements of our organization, and for that, I am truly thankful.

*Thank you*

Computer Technical Officer, Senior Professional Level  
Dr. Sumanya Ngandee  
AFSIS Manager

## Foreword

ASEAN Agricultural Commodity Outlook (ACO) Report is published semi-annually by the ASEAN Food Security Information System (AFSIS) Secretariat, using the data gathered from 10 ASEAN member states. Like previous editions, this report covers a current situation and a prospect of 5 main commodities including rice, maize, sugarcane, soybeans, and cassava.

In this latest of ASEAN Agricultural Commodity Outlook, it provides both national and regional information on production, utilization, monitoring the global food crisis and food insecurity, stock, trade, and FOB/CIF prices. The explanation for significant changes and unusual phenomena is also showed in this report. Furthermore, the report is scrutinized by all member states before publication.

# Rice Outlook for 2024

## Highlights

The forecast for rice supply in ASEAN predicts 1.45 million tons or 0.88 percent rise, increasing to 167.04 million tons in 2024 of milled rice from 165.59 million tons in 2023 (Table 1). This uptick in supply is primarily attributed to the augmented stock and production carried over from the previous year.

The beginning stock is forecasted to increase by 0.14 million tons or 0.48 percent increase from 29.12 million tons in 2023 to 29.26 million tons in 2024.

The rice production in 2024 is forecasted to be 130.63 million tons, increasing from 127.89 million tons in 2023, or 2.14 percent increase. On the other hand, imports are forecasted to decrease by 1.42 million tons or 16.55 percent from 8.58 million tons in 2023 to 7.16 million tons in 2024.

Considering only available data, rice export is expected to decrease 0.34 million tons or 1.74 percent from 19.57 million tons in 2023 to 19.23 million tons in 2024.

The ratio of production to domestic utilization (self-sufficiency ratio) for the region in 2024 is expected to be 111.63 percent. Additionally, the beginning stock to domestic utilization ratio (food security ratio) is estimated to be 25.00 percent in 2024 (Table 1).

**Table 1 Summary of the ASEAN rice situation, 2023-2024 (milled rice)**

Items	2023	2024	Unit: Million tons	
			Change	
			Quantity	%
Supply (Million tons)	165.59	167.04	1.45	0.88
Beginning stock	29.12	29.26	0.14	0.48
Production	127.89	130.63	2.74	2.14
Import	8.58	7.16	-1.42	-16.55
Demand (Million tons)	165.59	167.04	1.45	0.88
Domestic utilization	116.76	117.02	0.26	0.22
Export	19.57	19.23	-0.34	-1.74
Ending stock	29.26	30.79	1.53	5.23
Ratio of production to domestic utilization (%)	109.53	111.63	2.10	1.92
Ratio of beginning stock to domestic utilization (%)	24.94	25.00	0.06	0.24

## ASEAN Rice Situation in 2023

### ► *Production*

The estimated paddy production in ASEAN for the crop year 2022/23, reported in 2023 at 198.14 million tons, marking a growth of 2.95 million tons or 1.52 percent compared to the 195.18 million tons recorded in the previous crop year of 2021/22. This upswing was attributed to expansions in planted, harvested areas and yield. The increase in production observed in every country of ASEAN except for Indonesia. For Singapore, which have not reported data on rice cultivation. (Table 2-5, Figure 1-4).

For **Brunei**, the increase of production was attributed to the rise in yield, which was influenced by favorable weather, the use of more improved varieties, increased fertilizer application, and better care practices.

For **Cambodia**, the increase in production was credited to growth in both planted area and yield. The expansion in planted areas was driven by factors such as farmers responding to a price surge, government policies, and emergency interventions supplying seeds to farmers impacted by natural disasters like flooding and drought. Furthermore, government policies and emergency interventions related to the irrigation system were executed to boost production in the event of drought. Concurrently, the increase in yield was a consequence of adopting more advanced varieties, enhanced fertilizer application, and improved agricultural practices.

For **Lao PDR**, the increase of production was attributed to the rise in both planted area and yield. The increase in planted area was influenced by farmers responding to prices increases, a decrease in the prices of competing crops, favorable weather conditions, and government policies. Meanwhile, the increase in yield was attributed to adequate sunshine and rainfall during paddy growth, the utilization of

improved varieties, and improved care practices.

For **Malaysia**, the increase in production is attributed to the increase in planted area and yield. The planted area came from government policy. The increase of yield came from using more improved variety together with better taking care of the crops and add more fertilizer by farmers.

For **Myanmar**, the increase in production was attributed to the rise in both planted area and yield. The increase in planted area was driven by farmers responding to prices increase. Similarly, the increase in yield was influenced by the use of more improved varieties and improved care practices.

For **Thailand**, the increase of production was due to the increase in planted and yield. The increase in planted areas is attributed to the availability of sufficient water for cultivation. The increase in yield is attributed to suitable weather conditions and the availability of sufficient water for the growth of rice plants. The favorable weather, coupled with diligent care from farmers, contributes to the improved yield.

For **Vietnam**, the increase in production was attributed to the rise in yield, driven by favorable weather conditions.

For **Indonesia**, the decrease in production was attributed to a decrease in planted area. The reduction in planted area influenced by the competition of prices, as farmers sought higher returns from other commodities such as food crops or horticulture.

## ► *Utilization and Stock*

The estimated domestic utilization of rice (milled rice) in ASEAN for the calendar year 2023 reached 116.76 million tons, representing an increase from 114.86 million tons in 2022. This rise amounted to approximately 1.90 million tons, marking a percentage increase of 1.66 percent (Table 7-8).

***The ratio of production to domestic utilization (self-sufficient ratio) of ASEAN in 2023*** was estimated at 109.53 percent, a slight decrease from 109.99 percent in 2022. This suggests that, as a whole, rice production in ASEAN during 2022 was still sufficient to meet the regional demand. However, on the country-by-country basis, some countries in the region still need to import rice for their domestic consumption. The decline in the self-sufficiency ratio of production to domestic utilization decreased in Indonesia, Myanmar, and the Philippines. Meanwhile, the self-sufficiency ratio increased in Cambodia, Lao PDR, Malaysia, Thailand, and Vietnam. The highest ratio was found in Thailand, Vietnam, and Cambodia respectively, while the lowest ratio was in Brunei (Table 10, Figure 12).

The beginning stock in 2023 of ASEAN was estimated at 28.77 million tons, increasing 0.34 million tons from 29.11 million tons in 2022 or 1.19 percent. (Table 7-8).

The ratio of the beginning stock to the domestic utilization (**food security ratio**) in 2023 for the whole ASEAN was estimated at 24.94 percent, which slightly decreased about 0.11 percent from the previous year. Brunei, Cambodia and Myanmar have the-ratios above 50 percent of the optimum level (Table 11, Figure 13).

***For the overall production***, the data from the major crop namely rice, the staple food of the ASEAN region, demonstrates that many countries in the region ***have self-dependency in terms of food production and food security***. However, they still have to deal with the problem of high food prices which is one

of the determinants that cause food insecurity. As most of the producing countries in ASEAN are developing countries, the majority of populations in the countries have low income and middle-income which will be affected the most by the high food price crisis. This might raise the concerns of food insecurity in the future. On the other hand, this situation can be advantageous for rice export of ASEAN countries, especially for countries that have excessive supply for generating income from export.

## ► *Trade*

In 2023, the entire ASEAN region exported 19.57 million tons of milled rice, marking an increase of 1.64 million tons or 9.13 percent compared to the 17.93 million tons exported in 2022. Notably, the two primary exporting countries, Vietnam and Thailand, exporting approximately 9.22 million tons and 8.50 million tons, respectively in 2023 (Table 7-8 and Figure 5-6)

The total import by ASEAN in 2023 is estimated to be 8.58 million tons, an increase of 1.79 million tons or about 26.27 percent from 6.79 million tons in 2022. The Philippines was the biggest importer in the region, which imported 3.80 million tons of milled rice (Table 7-8, Figure 8-9).

The quantity and value of rice exported from ASEAN countries by countries of destination and the quantity and value of imported by countries of origin are given in Table 12-13.

### ► *Prices*

Monthly FOB prices of rice export and CIF prices for rice import in selected countries in ASEAN during 2022-2023 (January-December) is shown in Table 14 - 15 and Figure 14 -16.

### ► *Damaged Area*

In the crop year 2022/23, the estimated damaged area of paddy in ASEAN for the year 2023 amounted to 0.15 million hectares. Among this, 0.10 million hectares, constituting 67.99 percent, were attributed to flooding. Notably, Indonesia bore the brunt of the flood damage, accounting for 0.05 million hectares or 55.59 percent of the total damage across ASEAN. Additionally, factors such as drought, pests, and diseases contributed to the overall damage (Table 6).

## Prospects for Rice in 2024

### ► *Production*

ASEAN paddy production in 2024 (crop year 2023/24) is estimated at 201.84 million tons, increasing by 3.70 million tons, which is 1.87 percent from 198.14 million tons in 2023 (crop year 2022/23) (Table 2-5, Figure 1-4).

### ► *Utilization and Stock*

The domestic utilization of milled rice in ASEAN in 2024 is projected to be 117.02 million tons, increasing about 0.26 million tons or 0.22 percent compared to 116.76 million tons in 2023 (Table 8-9).

The beginning stock for 2024 is anticipated to be 29.26 million tons, reflecting an increase of 0.14 million tons or 0.48 percent from the 29.12 million tons recorded in 2023. Additionally, the ending stock is expected to see a rise of 1.54 million tons or 5.25 percent, growing from 29.26 million tons in 2023 to 30.80 million tons in 2024 (Table 8-9 and Figure 11).

The ratio of production to domestic utilization (**self-sufficient ratio**) is forecast to be 111.63 percent in 2024, which will increase from 109.53 percent in 2023. This indicates that rice production in ASEAN is still enough for consumption within the region (Table 10, Figure 12).

The ratio of the beginning stock to the domestic utilization (**food security ratio**) in ASEAN in 2024 is forecasted to increase 25.00 percent from 24.94 percent in 2023 (Table 11, Figure 13).

### ► *Trade*

The rice import from ASEAN is forecasted to decrease from 8.58 million tons in 2023, decrease of 1.43 million tons or about 1.43 percent to 7.16 million tons in 2024 (Table 8-9, Figure 8 and 10).

For the export, the whole ASEAN is forecasted to export 19.23 million tons in 2024, decrease of 0.34 million tons or about 1.74 percent compared to 19.57 million tons in 2023 (Table 8-9, Figure 5 and 7).

## Maize Outlook for 2024

The primary drivers behind the rise in ASEAN maize supply are the increase in production. The supply increase 0.33 percent or 0.20 million tons, slightly increase from 59.88 million tons in 2023 to 60.08 million tons in 2024 (Table 16).

The forecast indicates that maize beginning stock is set to decrease by approximately 1.26 million tons or 18.05 percent, decreasing from 6.98 million tons in 2023 to 5.72 million tons in 2024. Conversely, production of maize is increased by 3.55 percent or 1.29 million tons from 36.38 million tons in 2023 to 37.67 million tons in 2024.

The demand of maize in 2024 is expected to increase by approximately 60.08 million tons from 59.88 million tons in 2023. Domestic utilization is predicted to rise by 0.73 million tons, increasing from 51.93 million tons in 2023 to 52.66 million tons in 2024. Additionally, maize exports are projected to decrease by 0.83 million tons or 37.22 percent, down from 2.23 million tons in 2023 to 1.40 million tons in 2024.

The ending stock of maize is expected to slight increase around 5.24 percent from 5.72 million tons in 2023 to 6.02 million tons in 2024.

The ratio of production to domestic utilization (self-sufficiency ratio) for the region is expected to increase by 2.13 percent from 70.05 million tons in 2023 to 71.54 million tons in 2024.

The beginning stock to domestic utilization ratio referred to as the food security ratio, is expected to decrease by approximately 19.14 percent from 13.43 million tons in 2023 to 10.86 million tons in 2024.

**Table 16 Summary of the ASEAN maize situation, 2023 – 2024**

Unit: Million tons

Items	2023	2024	Change	
			Quantity	%

Ratio of production to domestic utilization (%)	70.05	71.54	1.49	2.13
Ratio of beginning stock to domestic utilization (%)	13.43	10.86	-2.57	-19.14

## ASEAN Maize Situation in 2023

### ► *Production*

ASEAN maize production in 2023 (crop year 2022/23) estimated at 41.47 million tons, which decreased by 2.49 million tons or 5.67 percent from 43.97 million tons in 2022 (crop year 2021/22). An increase in maize production in 2023 found in Cambodia, Malaysia, Myanmar, Thailand, and Vietnam due to the increase in either planted area and yield. While, the production of Indonesia, Lao PDR, Philippines decreased due to the declining of planted area and yield (Table 17-20, Figure 17-20).

For **Cambodia**, the increase in production was attributed to the rise in planted area, which came by farmers responding to a price increase.

For **Myanmar**, the increase in production was attributed to the rise in yield, which was driven by the use of more improved varieties and better care practices.

For **Malaysia**, the increase in production was attributed to the increase in planted area and harvested area. The increase came from government policy and using more improved variety together with better taking care of the crops and adding more fertilizer by farmers.

For **Thailand**, the maize production was attributed to an expansion in planted areas. This increase in cultivation was a response to farmers substituting maize for cassava in factories that are experiencing a shortage of plant stems. This shift was prompted by factors such as the past year's issues with rotten potatoes, as well as challenges posed by drought and rainy periods affecting the growth of cassava.

For **Vietnam**, the increase in production was attributed to a rise in both planted area and yield. The increase in the planted area was due to farmers responding to a price increase, while the increase in yield was influenced by favorable weather conditions.

For **the Philippines**, the decrease of production was attributed to a reduction in the planted area. This decline in planted areas were influenced by pest issues and reduced fertilizer usage.

For **Indonesia**, the decrease in production was attributed to a decrease in both planted area and yield. The reduction in the planted area was influenced by farmers responding to a price decrease, unfavorable weather, and competition with other commodities. Similarly, the decrease in yield was also caused by unfavorable weather in some parts of Indonesia.

For **Lao PDR**, the decrease of production was due to the decrease in planted area. The decrease in the planted area was a result of farmers responding to a decrease in prices, an increase in the price of competing crops, delayed rainfall, adverse weather conditions such as drought, and high prices of agricultural inputs.

### ► *Utilization and Stock*

In 2023, maize utilization in ASEAN was estimated at 51.93 million tons, reflecting an increase of 1.29 million tons or 2.56 percent compared to 50.63 million tons in 2022 (Table 22-23). The majority of maize production in ASEAN is dedicated to animal feed. The rise in domestic maize utilization has been observed throughout the entire ASEAN region, with the exception of Singapore.

The beginning stock of maize in ASEAN in 2023 was estimated at 6.97 million tons, which increased by 2.47 million tons from 4.50 million tons in 2022 (Table 22-23).

The ratio of maize production to domestic utilization, for the entire ASEAN region in 2023 was estimated at 70.05 percent, showing a decrease from 75.38 percent in 2022 (Table 25, Figure 28). This suggests that

ASEAN as a whole produced less maize than required for regional consumption. On a country basis, Cambodia, Lao PDR, and Myanmar had ratios above 100 percent, indicating that they produced more maize than needed for their domestic consumption. In contrast, Indonesia, the Philippines, Malaysia, Thailand, and Vietnam had ratios below 100 percent, implying that these countries still needed to import maize to meet their domestic utilization needs.

The ratio of beginning stock to domestic utilization (**food security ratio**) for the ASEAN in 2023 increased to 13.43 percent in 2023 from 8.88 percent in 2022 (Table 26, Figure 29).

***Overall, despite maize production in ASEAN decreased,*** the production volume was considerably insufficient for consumption within the ASEAN region because maize is the important raw material for animal feed industry. Therefore, many ASEAN countries still rely heavily on maize import from abroad.

**The Russia-Ukraine war has raised fertilizer prices, notably affecting maize, majorly produced and exported in the world.** This directly impacts ASEAN countries, heavily reliant on agriculture for income. High energy prices make agricultural equipment and fertilizer more costly, potentially causing sudden spikes in production costs. Maize-producing nations in ASEAN may face shortages, posing a risk to future food security.

### ► **Trade**

In 2023, ASEAN exported 2.23 million tons of maize, while importing 16.53 million tons (Table 23, Figure 21-22,

24-25). Myanmar, the largest exporter in ASEAN, was contributed 81.40 percent of the total maize exports, amounting to 1.82 million tons (Table 23, Figure 21-22).

The primary importing countries in the region include Vietnam, Thailand, Malaysia, Indonesia, the Philippines, and Singapore (Table 23, Figure 24-25). Detailed information regarding the quantity and value of maize exported by destination countries and the quantity and value of maize imported by origin countries could found in Table 27-28.

### ► **Prices**

The monthly FOB prices for maize exporting countries and CIF prices for importing countries of 2022 and 2023 are shown in Table 29-30 and Figure 30-31. The annual average of Indonesia FOB prices in 2023 was 579 US\$/tons, which increase from 521 US\$/tons as the yearly average in 2022.

For Lao PDR, Myanmar, and Thailand, average FOB prices of 2023 were 138, 229 and 350 US\$/tons, respectively. The average CIF prices in 2023 in Indonesia, Singapore and Vietnam were 324, 1,539 and 312 respectively.

### ► **Damaged Area**

The damaged area of maize in 2023 is estimated to be 9,859 hectares, of which 7,943 hectares were caused by drought. The most affected areas were caused by flood, drought and pest which occurred in Indonesia while the damage area of Myanmar was caused by flood (Table 21).

## Prospects for Maize in 2024

### ► *Production*

Maize production in ASEAN in 2024 (crop year 2023/24) was estimated at 43.19 million tons from 41.47 million tons in 2023. The increase has occurred in all ASEAN countries, except Thailand. The most increase in terms of quantity was found in Indonesia at approximately 20.80 million tons (Table 17).

For **Indonesia**, the increase in production is attributed to the rise in planted area. For the increase in planted area was caused by farmers responding to a price increase, favorable weather, government policy, and special assistance.

For **Lao PDR**, the increase of production is attributed to the increase in planted area and yield. The increase in planted area is attributed to farmers responding to price increases, a decrease in the price of competing crops, government policies, and the increase in yield is linked to favorable weather conditions and improved care practices.

For **Vietnam**, the increase in production is attributed to the increase in planted and harvested areas, which was caused by farmers' response to maize price increases.

For **Thailand**, the decrease of production is attributed to the decrease in planted area. The decrease in planted area is attributed to the impact of the El Niño phenomenon since 2023 has led to prolonged

drought conditions in the affected areas. This extended period of reduced rainfall, coupled with higher temperatures, has resulted in adverse effects on agriculture.

### ► *Utilization and Stock*

The domestic utilization of maize in ASEAN is forecasted to be 52.66 million tons in 2024 from 51.93 million tons in 2023 (Table 23-24). The estimated beginning stock for 2024 is 5.71 million tons, which is down by 1.25 million tons from 6.97 million tons in 2023.

In 2024, the ratio of production to domestic utilization (**self-sufficient ratio**) is expected to increase to 71.54 percent in 2024 from 70.05 percent in 2023 (Table 25, Figure 28), while the ratio of beginning stock to domestic utilization ratio (**food security ratio**) in 2024 is expected to be 10.86 percent, which decreases from 13.43 percent in 2023 (Table 26, Figure 29).

### ► *Trade*

The maize export from ASEAN is expected to decrease to 1.40 million tons in 2024 from 2.23 million tons in 2023. Concurrently, the forecast for maize imports by ASEAN in 2024 is 16.69 million tons, an increase from the 16.53 million tons imported in 2023 (Table 23-24, Figure 21, 23, 24, and 26).

# Sugar Outlook for 2024

ASEAN sugar supply is forecast to increase by approximately 1.31 percent or 0.46 million tons from 35.18 million tons in 2023 to 35.64 million tons in 2024, especially with the increase in beginning stock (Table 31).

The beginning stock of sugar in 2024 is estimated at 11.92 million tons, which increases from 8.80 million tons in 2023.

The sugar production in 2024 is estimated at 14.25 million tons, which decreases from 17.28 million tons in 2023.

The sugar's import of 2024 is forecasted to be 9.46 million tons, which increases around 3.84 percent from 9.11 million tons in 2023.

The export of sugar from ASEAN in 2024 is expected to increase from 7.42 million tons in 2023 to 8.99 million tons in 2024.

The production to domestic utilization ratio (self-sufficiency ratio) for sugar in 2024 is forecasted to be 86.28 percent, which decreases from 109.09 percent in 2023.

The beginning stock to domestic utilization ratio (food security ratio) in 2024 is forecasted to be 72.22 percent, which increases from 55.56 percent in 2023.

**Table 31 Summary of the ASEAN sugar situation, 2023 – 2024**

Unit: Million Tons

Items	2023	2024	Change	
			Quantity	%
Supply (Million tons)	35.18	35.64	0.46	1.31
Beginning stock	8.80	11.92	3.12	35.45
Production	17.28	14.25	-3.03	-17.53
Import	9.11	9.46	0.35	3.84
Demand (Million tons)	35.18	35.64	0.46	1.31
Domestic utilization	15.84	16.52	0.68	4.29
Export	7.42	8.99	1.57	21.16
Ending stock	11.92	10.13	-1.79	-15.02
Ratio of production to domestic utilization (%)	109.09	86.28	-22.81	-20.91
Ratio of beginning stock to domestic utilization (%)	55.56	72.22	16.66	29.99

## ASEAN Sugar Situation in 2023

### ► *Production*

Sugarcane production in ASEAN in 2023 (2022/23 crop year) was estimated at 167.17 million tons, decreased 3.87 million tons from 171.04 million tons in 2022 or 2.26 percent (Table 32, Figure 32) include Indonesia, Lao PDR, Myanmar and Philippines. On the other hand, the increase in production occurred in Cambodia, Thailand and Vietnam.

For **Cambodia**, the increase in production was attributed to the rise in yields. This increase in yield was due to favorable weather, the use of more improved varieties, increased fertilizer application, and better care practices.

For **Thailand**, the increase was due to the increase in planted area. The increase in planted area is driven by high sugarcane prices and favorable returns, encouraging farmers to not only sustain but also expand their sugarcane cultivation. Additionally, the government's policy supports sugarcane farmers in cutting fresh sugarcane to enhance their income, compared to cutting burnt sugarcane.

For **Vietnam**, the increase in production was attributed to the rise in both planted area and yield. The increase in planted area was due to farmers responding to a price increase, while the increase in yield was influenced by the use of more fertilizer.

For **Indonesia**, the decrease in production was attributed to a decrease in planted area, caused by the influence of El Niño.

For **Philippines**, the decrease of production was attributed to a reduction in the yield. This decline in yield resulted from using less fertilizer due to high costs, and the first and second ratoon resulted in smaller canes.

For **Myanmar**, the decrease in production was attributed to the reduction in planted area, driven by the increase in the price of agricultural inputs such as seed cane and fertilizers.

For **Lao PDR**, the decrease of production was attributed to a reduction in the planted area. The decline in planted area resulted from unfavorable weather conditions.

### ► *Utilization and Stock*

The domestic utilization of sugar in the ASEAN, it has decreased to 15.83 million tons in 2023 from 17.63 million tons in 2022 (Table 37-38). The beginning stock of sugar in ASEAN in 2023 was estimated at 9.14 million tons, which significantly increased from 7.48 million in 2022. The ending stock of sugar in ASEAN in 2023 was estimated to be 12.27 million tons compared to 9.14 million tons in 2022.

The ratio of sugar production to domestic utilization (**self-sufficient ratio**) in 2023 was estimated to be 109.09 percent compare to 2022 by 96.11 percent. **This indicated that the ASEAN itself produced adequate sugar for the regional consumption** (Table 40, Figure 43). Moreover, on the country-by-country basis, sugar production in Cambodia, Thailand and Philippines exceeds the demand for their domestic consumption.

The ratio of beginning stock to domestic utilization (**food security ratio**) was estimated to be 57.72 percent in 2023, compared to 42.46 percent in 2022. **This indicated that the sugar availability in the region was increase from the previous year** (Table 41, Figure 44).

*Overall, despite sugar production in ASEAN decreased, the production volume was sufficient for consumption within the ASEAN region. However, many ASEAN countries still rely on sugar import*

from aboard. Even through sugar may not be a staple food for the ASEAN region, it is an important ingredient used in many kinds of food, especially in the desserts industry.

***Sugar is also an alternative food ingredient for people in many countries in the world, which are facing food crisis.***

According to the analysis of sugar price, world export, and demand of sugar, the sugar producing countries will produce more sugar in order to meet the demand in ASEAN region. Thus, these countries will earn high revenue from their export.

### ► **Trade**

The sugar's export from ASEAN in 2023 was 7.42 million tons, which decreased compared to 7.74 million tons in 2022 or 4.13 percent (Table 37-38, Figure 36-37). For the import, ASEAN in 2023 as a whole imported sugar around 9.11 million tons decreasing compare to 10.08 million tons in 2022 (Table 37-38, Figure 39-40).

The quantity and value of sugar export by countries of destination and the quantity and value of import by countries of origin are given in Tables 42 and 43, respectively.

### ► **Prices**

The FOB and CIF prices of sugar in exporting and importing countries in ASEAN during 2022-2023 are shown in Tables 44-45. The annual average of Thailand FOB prices in 2023 (January-December) of raw sugar estimated by 471 US\$/tons and white sugar estimated by 611 US\$/tons. The prices of raw sugar of 2023 were higher than those of 2022, likewise, the prices of white sugar of 2023 were higher than those of 2022.

### ► **Damaged Area**

The sugarcane damaged area in ASEAN in 2023 was reported to be 1,662 hectares, which occurred in Cambodia due to flood (Table 36).

## Prospects for Sugar in 2024

### ► *Production*

Sugarcane production in ASEAN is forecasted to decrease from 167.17 million tons in 2023 to 151.51 million tons in 2024 (Table 32-35, Figure 32-35). The sugarcane production trends for 2024 in ASEAN countries depict a mixed scenario. Cambodia, Indonesia, the Philippines, and Thailand are anticipated to experience a decrease in sugarcane production. On the other hand, Lao PDR, Myanmar, and Vietnam are expected to increase in sugarcane production. **Thailand**, the largest sugarcane-producing country in the region, is forecasted to decrease its production from 93.89 million tons in 2023 to 82.40 million tons in 2024.

For **Lao PDR**, the increase of production was attributed to the growth in both planted area and yield. The increase in planted area was driven by farmers responding to price increases, a decrease in the price of competing crops, favorable weather, and government policies. Similarly, the increase in yield was influenced by favorable weather conditions and improved care practices.

For **Myanmar**, the increase in sugarcane production attributed to a growth in yield. This improvement came from a result of favorable weather conditions, the adoption of enhanced agricultural practices such as increased fertilizer use, and improved overall care of the sugarcane crops by farmers.

For **Vietnam**, the increase in production was attributed to the rise in both planted area and yield. The increase in planted area was due to farmers responding to a price increase, while the increase in yield was influenced by the use of more fertilizer.

For **Philippines**, the decrease was attributed to a reduction in the planted area. This decline in planted area resulted from using less fertilizer due to high costs, and the first and second ratoon resulted in smaller canes.

For **Thailand**, the decrease was due to the decrease in planted area and yield. The decrease in planted area is a result of drought occurrences. The decrease in yield can be attributed to high production factors such as expensive fertilizer costs, harvesting costs, etc.

### ► *Utilization and Stock*

The domestic utilization of sugar in ASEAN is forecasted to increase from 15.83 million tons of sugar in 2023 to 16.51 million tons in 2024, which increases 0.68 million tons (Table 38-39). The beginning stock in ASEAN is estimated at 12.27 million tons of sugar in 2024, an increase of 3.13 million tons from 9.14 million tons in 2023. The ending stock of sugar in ASEAN in 2024 is forecasted 10.47 million tons which decreases from 12.26 million tons in 2023.

The ratio of production to domestic utilization in 2024 is forecast to be 86.28 percent, which is lower than the previous year from 109.09 percent. (Table 40, Figure 43).

The ratio of the beginning stock to domestic utilization in 2024 is forecast to be 74.29 percent, which increase from 57.72 percent in 2023 (Table 41, Figure 44).

### ► *Trade*

The export is predicted to increase from 7.42 million tons in 2023 to 8.99 million tons in 2024 (Table 38-39, Figure 36-38). The import is expected 9.46 million tons in 2024, which increases from 9.11 million tons in 2023 (Tables 38-39, Figure 39-41).

## Soybean Outlook for 2024

### Highlights

The forecast for the supply of ASEAN soybeans indicates an increase from 9.69 million tons in 2023 to 10.38 million tons in 2024, representing 0.69 million tons or 7.12 percent growth (Table 46). This growth in supply primarily stems from increases in beginning stock, production and imports.

The soybean production for 2024 is 0.68 million tons, reflecting an increase from the previous year's production of 0.53 million tons. This indicates a positive trend in soybean supply within the ASEAN region for the specified period. In 2024, the forecasted beginning stock of soybeans in ASEAN is expected to increase to 0.73 million tons, a rise of 0.03 million tons or approximate 4.29 percent increase from the 0.70 million tons recorded in 2023. Furthermore, the anticipated ending stock for 2024 is 1.11 million tons, an increase of approximately 52.05 percent from the 0.73 million tons reported in 2023. These figures suggest a positive outlook for soybean stocks in the region during the specified period.

In terms of soybean's demand in ASEAN in 2024, the domestic utilization is estimated at 9.24 million tons, which increases in the demand for 0.07 million tons from 8.94 million tons in 2023.

The export in 2024 is forecasted to be 0.03 million tons from 0.02 in 2023. This indicates that ASEAN exports very small amounts of soybeans.

The production to domestic utilization ratio (self-sufficiency ratio) in 2024 is forecasted to be 7.37 percent, which increase from 5.95 percent from the previous year.

The beginning stock to domestic utilization ratio (food security ratio) is predicted to be 7.94 percent in 2024, which increases from 7.84 percent.

**Table 46 Summary of the ASEAN soybean situation, 2023 – 2024**

Items	2023	2024	Unit: Million tons	
			Change	
			Quantity	%
Supply (Million tons)	9.69	10.38	0.69	7.12
Beginning stock	0.70	0.73	0.03	4.29
Production	0.53	0.68	0.15	28.30
Import	8.46	8.96	0.50	5.91
Demand (Million tons)	9.69	10.38	0.69	7.12
Domestic utilization	8.94	9.24	0.30	3.36
Export	0.02	0.03	0.01	50.0
Ending stock	0.73	1.11	0.38	52.05
Ratio of production to domestic utilization (%)	5.95	7.37	1.42	23.87
Ratio of beginning stock to domestic utilization (%)	7.84	7.94	0.10	1.28

## ASEAN Soybean Situation 2023

### ► *Production*

The estimated soybean production in ASEAN for the crop year 2022/23 (2023) is 0.53 million tons, reflecting a decrease of 0.06 million tons from the 0.59 million tons recorded in 2022 (crop year 2021/22). The soybean production in Indonesia has experienced a decline, and Indonesia holds the leading position in soybean production within the region. Following Indonesia, other countries contributing to soybean production in the region include Myanmar, Vietnam, Thailand, Cambodia, Lao PDR, and the Philippines. (Table 47-50 and Figure 47-50.)

For **Cambodia**, the increase in production was attributed to the rise in both planted area and yield. The increasing in planted areas was influenced by farmers responding to a price increase. Similarly, the increase in yield attributed to the use of more fertilizer and better care practices.

For **Lao PDR**, the increase of production was due to the increase in planted area and yield. The increase in the planted area is due to farmers responding to price increases, a decrease in the price of competing crops, and government policies. Similarly, the increase in yield attributed to favorable weather conditions and improved care practices.

For **Myanmar**, the increase in production was attributed to the rise in planted area, driven by farmers responding to a price increase.

For the **Philippines**, the increase of production was attributed to the rise in yield. The increase in the yield linked to using more fertilizer and better care practices.

For **Thailand**, the increase was due to the increase in planted area and yield. The increase in the planted area attributed

to favorable soybean prices and high yield, which encourage farmers to not only continue cultivating soybeans but also expand their acreage. There is ample water available for cultivation. Similarly, the increase in yield can be attributed to suitable weather conditions. The favorable weather, unaffected by cold temperatures, has positively impacted the soybean crops.

For **Vietnam**, the increase in production was attributed to the rise in both planted area and yield. The increase in planted area was due to farmers responding to a price increase and government policy, while the increase in yield was influenced by favorable weather.

For **Indonesia**, the decrease in production was attributed to a decrease in both planted area and yield. The reduction in planted area was influenced by farmers responding to a decrease in prices, an increase in the price of competing crops, and unfavorable weather. Similarly, the decrease in yield was also caused by unfavorable weather conditions.

### ► *Utilization and Stock*

The domestic utilization of soybeans in ASEAN in 2023 was estimated at 8.93 million tons, representing an increase of 0.40 million tons or about 4.69 percent from the 8.53 million tons reported in 2022. Concurrently, the beginning stock in 2023 estimated at 0.70 million tons, reflecting an increase of 0.12 million tons or 20.30 percent from the 0.58 million tons recorded in 2022. Among the ASEAN countries, Myanmar had the highest soybean stock, followed by Indonesia and Vietnam in 2023 (Table 52-53).

The self-sufficiency ratio, which represents the ratio of production to domestic utilization in ASEAN for 2023, was 5.95 percent, indicating a decrease of approximately 7.00 percent from the previous year (Table 55, Figure 58). Additionally, the food security ratio, which signifies the ratio of beginning stock to domestic utilization in ASEAN for 2023, was estimated to be 7.84 percent, showing an increase from 6.82 percent in previous year (Table 56, Figure 59).

**In summary, although soybean production in ASEAN has decreased, the overall volume remains sufficient to meet consumption demands within the region.** Consequently, many ASEAN countries continue to heavily depend on soybean imports and show a tendency to increase these imports. While soybeans may not be a primary crop for direct human consumption in the ASEAN region, their significance lies in serving as a crucial raw material for animal feed and cooking oil production. This importance stems from the need to consume a diverse range of products resulting from economic growth within the population.

**The impact of the Russia-Ukraine war,** including rising fertilizer prices, shortages, high energy prices, and an increase in the cost of food, is affecting soybean-producing countries in the ASEAN region. This situation has the potential to lead to soybean shortages and food insecurity in the future.

## ► *Trade*

In 2023, ASEAN totally exported soybean 22,141 tons, which decreased 25,700 tons from 47,841 tons in 2022. Moreover, total of ASEAN countries imported soybean 8.46 million tons, which increased 0.35 million tons from 8.10 tons in 2022 (Table 52-53, Figure 51-52).

The quantity and value of soybean export by countries of destination and the quantity and value of soybean import by countries of origin are given in Table 57-58.

## ► *Prices*

The monthly FOB price of soybean for exporting countries during 2022-2023 are shown in Table 59 and the monthly CIF prices for importing countries are shown in Table 60. (Table 59, Figure 60)

## *Damaged Area*

The total damaged area of soybean in the ASEAN in 2023 was estimated to be 363 hectares. The major cause of damage was flood, drought and pest which constituted about 52.89 percent, 23.69 percent and 23.42 percent respectively. The majority of damage areas occurred in Indonesia (Table 51).

## Prospects for Soybean in 2024

### ► *Production*

The forecast for soybean production in ASEAN in 2024 indicates an expected increase to 0.60 million tons, marking a growth of approximately 14 percent compared to the production of 2023 as 0.53 million tons (Table 47, Figure 47). This anticipated rise is particularly notable in Indonesia, Cambodia, Vietnam, and the Philippines. Conversely, a decrease in production is expected in Lao PDR, Myanmar, and Thailand.

Indonesia, being the largest soybean-producing country in ASEAN, is projected to undergo a significant production increase, rising from 0.22 million tons in 2023 to 0.36 million tons in 2024. This growth in Indonesian production is attributed to the expansion of both planted and harvested areas, as indicated in Table 47-50 and Figure 47-50. The dynamics in soybean production across ASEAN countries demonstrate the various factors influencing the agricultural landscape in the region.

For **Cambodia**, the increase in production was attributed to the rise in yield. This increase in yield was due to favorable weather and government policy.

For **Indonesia**, the increase in production was attributed to the rise in both planted area and yield. The increase in planted area was caused by farmers responding to a price increase and favorable weather conditions. Similarly, the increase in yield was also influenced by favorable weather and improved care practices.

For **Lao PDR**, the decrease was attributed to a reduction in the planted area. This decline in planted areas is a result of farmers shifting to other crops due to high prices.

For **Thailand**, the decrease was due to the decrease in planted area and yield.

The decrease in planted areas came from farmers have a shortage of cuttings due to the rotten tuber and drought situation in the beginning of 2023, causing damage to cuttings planted in the 2023/24 cropping season. As a result, the species are in short supply and have high prices. The decrease in yield resulted from floods and diseases.

### ► *Utilization and Stock*

The domestic utilization of soybeans in ASEAN is forecast to increase by 3.38 percent from 8.93 million tons in 2023 to 9.24 million tons in 2024 (Table 53-54).

The beginning stock in ASEAN in 2024 is forecast to increase by 0.03 million tons or about 4.77 percent from 0.70 million tons in 2023 to 0.73 million tons in 2024 (Table 53-54). On the contrary, the ending stock in ASEAN in 2024 is forecast to increase from 0.73 million tons in 2023 to 1.11 million tons in 2024, which dramatic increases 0.38 million tons or 51.48 percent (Table 53-54, Figure 57).

In 2024, the ratio of production to domestic utilization (self-sufficiency ratio) is forecast to be 7.37 percent, which increases from 5.95 percent in 2023 (Table 55, Figure 58). The ratio of beginning stock to the domestic utilization (food security ratio) is forecast to be 7.94 percent in 2024, which increases 7.84 percent from the previous year (Table 56, Figure 59).

### ► *Trade*

In 2024, the export of soybeans from the ASEAN is forecast to 26,391 tons, increasing 4,250 tons or 19.19 percent compared to the previous year. While the total import by the ASEAN in 2024 is expect to be 8.96 million tons, increasing 0.50 million tons from 8.46 million tons in 2023 (Table 53 and 54, Figure 51, 53, 54, and 56)

# Cassava Outlook for 2024

## Highlights

In 2024, the supply of cassava in ASEAN is forecast to be 105.93 million tons, a decrease of 1.45 million tons or 1.35 percent from 107.38 million tons in 2023 (Table 61).

The beginning stock of cassava in 2024 is expected to increase 13.24 million tons, which increases by 6.01 million tons or 83.13 percent from 7.23 million tons in 2023 due to the increase in stock in Cambodia, Thailand (Table 61, 68-69). While the ending stock in 2024 is expected to drop 10.73 million tons, which decreases from 13.24 million tons in 2023 (Table 61).

The export of cassava is expected to increase by 3.14 million tons or around 8.37 percent from 37.50 million tons in 2023 to 40.64 million tons in 2024. In addition, the import of cassava is forecasted to be 13.59 million tons in 2024, which decreases 14.64 percent from 15.92 million tons in 2023 (Table 61).

The ratio of production to domestic utilization (self-sufficiency ratio) in 2024 is forecasted to be 145.00 percent, which decreases 2.50 percent from 148.20 percent in 2023. The ratio of beginning stock to domestic utilization (food security ratio) in 2024 is forecast to be 24.28 percent, which increases 90.13 percent from 12.77 percent in 2023 (Table 61).

**Table 61 Summary of the ASEAN cassava situation, 2023-2024**

Unit: Million tons

Items	2023	2024	Change	
			Quantity	%

Ratio of production to domestic utilization (%)	148.72	145.00	-3.72	-2.50
Ratio of beginning stock to domestic utilization (%)	12.77	24.28	11.51	90.13

## ASEAN Cassava Situation in 2023

### ► *Production*

In 2023 (crop year 2022/23), the estimated cassava production (root fresh) in ASEAN was 84.23 million tons, marking a 3.08 percent increase from the 81.71 million tons recorded in 2022. The increase in soybean production is anticipated in Indonesia, Lao PDR, Malaysia and Philippines. On the other hand, a decrease in production is expected in Cambodia, Myanmar, Thailand and Vietnam. (Table 62-65 and Figure 62-65)

Notably, Thailand, which reported the highest production volume, experienced a decrease of 9.79 percent, equivalent to 3.33 million tons from 34.06 million tons in 2022 to 30.73 million tons in 2023.

For **Indonesia**, the increase in production was attributed to the rise in both planted area and yield. The increase in planted area was influenced by farmers respond to price increase and Price of competing crop decrease. Similarly, the increase in yield was also caused by favorable weather and taking care better

For **Lao PDR**, the increase in production was due to the increase in planted area and yield. The increase in planted areas resulted from farmers responding to price increases, a decrease in the price of competing crops, and government policies. Similarly, the increase in yield can be attributed to favorable weather conditions and improved care practices.

For **the Philippines**, the increase in production was due to the increase in yield. The increase in yield can be attributed to favorable weather conditions, specifically sufficient rainfall, along with the use of more fertilizer and improved care practices.

For **Myanmar**, the decrease in production was attributed to the reduction in planted area, driven by the increase in the price of agricultural inputs such as seeds and fertilizers.

For **Thailand**, the decrease was due to the decrease in planted and yield. The decrease in planted areas came from the reduction in planted areas since the end of September 2022 was primarily influenced by the effects of Noru Storm, which brought heavy rain and flooding to certain regions. Consequently, the cassava roots of some factories in these areas were extensively damaged. Additionally, the impact of the El Niño phenomenon resulted in a lack of rainfall from January to June 2023. This condition affected cassava plants planted at the beginning of the season (from October 2022 to January 2023) with some not germinating or standing dead, necessitating repairs or replanting. Between May and July 2023, the unfavorable conditions made it impossible to harvest during this season. Despite efforts in some areas where farmers expanded their cultivation areas to replace animal feed corn, factory sugarcane and Batavia pineapples, the overall harvested area continued to decrease. The decrease in yield can be attributed to floods, diseases and the lack of rain from January to June 2023, which has led to stunted growth of cassava roots from the factory.

For **Vietnam**, the decrease in production was attributed to the decrease in both planted area and yield. The decrease in planted area was due to farmers responding to a price decrease, while the decrease in yield was influenced by using less fertilizer.

### ► *Utilization and Stock*

**The cassava root in ASEAN serves various purposes, including human food, animal feed, and ethanol production.** In 2023, the estimated domestic utilization of cassava for all purposes in ASEAN was 56.64 million tons, reflecting a decrease of 2.86 million tons or 4.82 percent from the 59.50 million tons in 2022 (Table 67-68).

The beginning stock of 7.23 million tons in 2023 represents a substantial decrease by 8.54 million tons or approximately 99.59 percent from 15.77 million tons in 2022. Conversely, the ending stock of cassava in 2023 was estimated to be 13.24 million tons, indicating an increase of 6.01 million tons from the 7.23 million tons in 2022.

In 2023, the estimated ratio of production to domestic utilization (**self-sufficient ratio**) raised to 148.72 percent, showing an increase from the 137.33 percent recorded in 2022. **This indicated that, aggregately, the cassava production in ASEAN is sufficient for the demand within ASEAN** (Table 70, Figure 73).

In 2023, the ratio of the ASEAN beginning stock to domestic utilization (food security ratio) is estimated to be 12.77 percent, which decreased from 26.51 percent in 2022 (Table 71, Figure 74).

The cassava production data for ASEAN highlights the self-dependency of many countries in the region, contributing to food security. While cassava is not a staple food in the ASEAN region, it holds significant importance as a raw material for animal feed and energy. In the context of the current food crisis, countries with surplus cassava supply in the ASEAN

region can leverage this advantage by exporting cassava, leading to potential high revenue from exports.

### ► *Trade*

The cassava exported from ASEAN in 2023 is expected to be 37.50 million tons, which decreased 6.30 million tons from 43.80 million tons in 2022. The cassava imported by ASEAN in 2023 was estimated to be 15.92 million tons, which increased by approximately 2.87 million tons from 13.05 million tons in 2022 (Table 67-68, Figure 66-67, and 69-70).

The quantity and value of cassava export by countries of destination and the quantity and value of cassava import by counties of origin are given (Table 72 and 73.)

### ► *Prices*

Table 74-75 provides insights into the FOB prices of cassava in Indonesia, Lao PDR, Malaysia, Myanmar, Thailand, and Vietnam for the years 2022 and 2023, along with CIF prices in Indonesia, Malaysia, and Singapore. Notably, the average FOB prices of starch, pellets, and shredded cassava in Thailand 2023 compared to the previous year.

# Prospects for Cassava in 2024

## ► *Production*

The forecast for cassava production in ASEAN in 2024 anticipates a total of 79.10 million tons. This projection reflects a decrease of 5.12 million tons or approximately 6.09 percent compared to the 2023 production of 84.23 million tons. The increase in soybean production is anticipated in Cambodia, Malaysia and Myanmar. On the other hand, a decrease in production is expected in Indonesia, Lao PDR, Philippines, Thailand and Vietnam. (Table 62-65, Figure 62-65).

For **Cambodia**, the increase in production was attributed to the rise in both planted areas. This increase in planted area was driven by farmers responding to a price increase and favorable weather.

For **Lao PDR**, the decrease in production was attributed to a reduction in the planted area. This decline in planted areas was influenced by an increase in the price of competing crops.

For **Indonesia**, the decrease in production was attributed to the decrease in planted area. This decline in planted area was influenced by farmers responding to a price decrease and an increase in the price of competing crops.

For **Thailand**, the decrease was due to the decrease in planted and yield. The decrease in planted areas came from farmers have a shortage of cuttings due to the rotten tuber situation last year, and in the beginning of 2023, they experienced drought, causing damage to cuttings planted in the 2023/24 cropping season. Therefore, farmers must replant many times. As a result, the species are in short supply have high prices. The decrease in yield resulted from floods and diseases.

For **Vietnam**, the decrease in production was attributed to the decrease in both planted area and yield. The decrease in planted area was due to farmers responding to a price

decrease, while the decrease in yield was influenced by using less fertilizer.

## ► *Utilization and Stock*

The forecast for the domestic utilization of cassava in 2024 anticipates a decrease to 54.55 million tons, compared to 56.63 million tons in 2023, marking a reduction of 2.08 million tons. The beginning stock for 2024 is projected to be 13.24 million tons, reflecting an increase of 6.00 million tons from the 7.24 million tons recorded in 2023. However, the ending stock for 2024 is expected to be 10.73 million tons, indicating a decrease of 2.51 million tons from the 13.24 million tons reported in 2023 (Table 68-69).

The forecasted ratio of production to domestic utilization (self-sufficient ratio) for 2024 is expected to be 145.00 percent, showing a slight decrease from 148.72 percent in 2023 (Table 70, Figure 73). Additionally, the projected ratio of beginning stock to domestic utilization (food security ratio) for 2024 is 24.28 percent, representing an increase from 12.77 percent in 2023. This indicates a strengthening cassava supply situation in ASEAN (Table 71, Figure 74).

## ► *Trade*

The forecast for cassava exports from ASEAN in 2024 indicates an increase to 40.64 million tons, rising by 3.14 million tons compared to 37.50 million tons in 2023. Conversely, imports are estimated to decrease to 13.59 million tons in 2024, down by approximately 2.33 million tons from 15.92 million tons in 2023 (Table 68-69, Figures 66, 68, 69, and 71).

## **Explanatory Notes**

### **Production of Paddy for 2023**

#### **▶ Brunei:**

- Wet season refers to the crop harvested during February to July 2023.
- Dry season refers to the crop harvested during July to November 2023.

#### **▶ Cambodia:**

- Wet season refers to the crop harvested during August to December 2023.
- Dry season refers to the crop harvested during February to April 2022.

#### **▶ Indonesia:**

- Wet season refers to the crop harvested during January 2023 to June 2023.
- Dry season refers to the crop harvested during July to December 2023.

#### **▶ Lao PDR:**

- Wet season refers to the crop harvested during September to December 2023.
- Dry season refers to the crop harvested during February to May 2023.

#### **▶ Malaysia:**

- Wet season refers to the crop harvested during August 2022 to February 2023.
- Dry season refers to the crop harvested during February to July 2023.

#### **▶ Myanmar:**

- Wet season refers to the crop harvested during August 2022 to February 2023.
- Dry season refers to the crop harvested during February to August 2023.

#### **▶ Philippines:**

- Wet season refers to the crop harvested during July to December 2022.
- Dry season refers to the crop harvested during January to June 2023.

#### **▶ Thailand:**

- Wet season refers to the crop harvested during July 2022 to May 2023.
- Dry season refers to the crop harvested during February to October 2023.

#### **▶ Vietnam:**

##### **❖ Spring-season**

- North refers to the crop harvested during May to July 2023.
- South refers to the crop harvested during March to June 2023.

##### **❖ Autumn-season**

- North refers to the crop harvested during August to October 2023.
- South refers to the crop harvested during July to September 2023.

##### **❖ Winter-season**

- North refers to the crop harvested during October to November 2023.
- South refers to the crop harvested during October to December 2023.

## Production of Maize for 2023

### ▶ Brunei:

- Wet season refers to the crop harvested during January to June 2023.
- Dry season refers to the crop harvested during July to December 2023.

### ▶ Cambodia:

- Wet season refers to the crop harvested during July to December 2023.
- Dry season refers to the crop harvested during February to March 2023.

### ▶ Indonesia:

- 1<sup>st</sup> crop harvested during January to April 2023.
- 2<sup>nd</sup> crop harvested during May to August 2023.
- 3<sup>rd</sup> crop harvested during September to December 2023.

### ▶ Lao PDR:

- Wet season refers to the crop harvested during May to September 2023.
- Dry season refers to the crop harvested during November 2022 to March 2023.

### ▶ Myanmar:

- Wet season refers to the crop harvested during August to December 2020.
- Dry season refers to the crop harvested during January to June 2023.

### ▶ Philippines:

- Wet season refers to the crop harvested during July to December 2022.
- Dry season refers to the crop harvested during January to June 2023.

### ▶ Thailand:

- Wet season refers to the crop harvested during June 2023 to February 2024.
- Dry season refers to the crop harvested during February to May 2023.

### ▶ Vietnam:

- 1<sup>st</sup> crop harvested during April to June 2023.
- 2<sup>nd</sup> crop harvested during October to November 2023.

## Production of Sugarcane for 2023

### ▶ Brunei:

- The crop harvested during January to December 2023.

### ▶ Cambodia:

- The crop harvested during December 2022 to January 2023.

### ▶ Indonesia:

- The crop harvested during February to December 2023.

### ▶ Lao PDR:

- The crop harvested during February to May 2023.

### ▶ Myanmar:

- The crop harvested during October 2022 to June 2023.

### ▶ Philippines:

- The crop harvested during October 2022 to June 2023.

### ▶ Thailand:

- The crop harvested during December 2022 to April 2023.

### ▶ Vietnam:

- The crop harvested during November 2022 to May 2023.

## Production of Soybean for 2023

### ▶ **Cambodia:**

- The crop harvested during September to October 2023.

### ▶ **Indonesia:**

- 1<sup>st</sup> crop harvested during January to April 2023.
- 2<sup>nd</sup> crop harvested during May to August 2023.
- 3<sup>rd</sup> crop harvested during September to December 2023.

### ▶ **Lao PDR:**

- Wet season refers to the crop harvested during May to October 2023.
- Dry season refers to the crop harvested during November 2022 to February 2023.

### ▶ **Myanmar:**

- Wet season refers to the crop harvested during August 2022 to January 2023.
- Dry season refers to the crop harvested during December 2022 to May 2023.

### ▶ **Philippines:**

- Wet season refers to the crop harvested during August to December 2022.
- Dry season refers to the crop harvested during January to June 2023.

### ▶ **Thailand:**

- Wet season refers to the crop harvested during August to December 2022.
- Dry season refers to the crop harvested during January to May 2023.

### ▶ **Vietnam:**

- Wet season refers to the crop harvested during February to May 2023.
- Dry season refers to the crop harvested during August to November 2023.

## Production of Cassava for 2023

### ▶ Brunei:

- The crop harvested during January to December 2023.

### ▶ Cambodia:

- The crop harvested during November 2022 to January 2023.

### ▶ Indonesia:

- 1<sup>st</sup> crop harvested during January to April 2023.
- 2<sup>nd</sup> crop harvested during May to August 2023.
- 3<sup>rd</sup> crop harvested during September to December 2023.

### ▶ Lao PDR:

- The crop harvested during October to November 2023.

### ▶ Malaysia:

- The crop harvested during October 2022 to December 2023.

### ▶ Myanmar:

- The crop harvested during September 2022 to June 2023.

### ▶ Philippines:

- 1<sup>st</sup> crop harvested during September to December 2022.
- 2<sup>nd</sup> crop harvested during January to June 2023.

### ▶ Thailand:

- The crop harvested during October 2022 to September 2023.

### ▶ Vietnam:

- Wet season refers to the crop harvested during September to October 2023.
- Dry season refers to the crop harvested during January to March 2024.

**Domestic Utilization, Stock, Import and Export: refer to calendar year**

**nil: Small amount**

## Milling Rate of Rice (2023)

Unit: Tons

Country	Paddy	Rice
ASEAN	1	0.64
Brunei	1	0.65
Cambodia	1	0.64
Indonesia	1	0.63
Lao PDR	1	0.60
Malaysia	1	0.70
Myanmar	1	0.63
Philippines	1	0.67
Thailand	1	0.65
Vietnam	1	0.65

## Extraction rate of Sugar (2023)

Unit: Tons

Country	Sugarcane	Sugar
ASEAN	1,000	95.44
Cambodia	1,000	100.00
Indonesia	1,000	72.01
Lao PDR	1,000	200.00
Myanmar	1,000	79.94
Philippines	1,000	88.02
Thailand	1,000	117.79
Vietnam	1,000	100.00

Remark: The extraction rate of sugar from Thailand 2023 is change to 117.79 tons of sugar convert from 1000 tons of sugarcane, reported by Global Agricultural Information Network (GAIN).
